

Vertebrate Analysis

Even with the absence of vertebrates the experiments and observations on this transect were able to determine a large spectrum of organisms exemplifying that there is so much going on beneath the surface and beyond what the human eye can see. Possible vertebrates that could live in this transect are rabbits, squirrels, sparrows, robins, and other birds, and chipmunks. These were determined by the seeds found, acorns bitten, other food remains and sources such as plants and other grasses.

Figure 1: Food Web for Transect One

The food web demonstrates organism interactions in the transect one ecosystem. Food web shows which organisms are primary producers, as well as primary, secondary, and tertiary consumers.
